

IN THE CLAIMS

1 (currently amended). A multi-layer film combination comprising a propylene substrate having a medium density polyethylene skin layer having a density of about 0.92 - 0.94 g/cc on at least one side of the substrate, the polyethylene skin having a thin metal layer deposited thereon.

pt4
2 (original). The combination as claimed in Claim 1, wherein the substrate is propylene homopolymer.

3 (original). The combination as claimed in Claim 1, wherein the substrate is propylene copolymer.

4 (original). The combination as claimed in Claim 1, wherein the substrate is propylene terpolymer.

5 (canceled).

6 (canceled).

7 (original). The combination as claimed in Claim 1, wherein the film has a total film thickness of about 12.5 to about 45 microns.

8(original). The combination as claimed in Claim 1, wherein the polyethylene skin layer has a thickness from about 1 micron or less.

9 (original). The combination as claimed in Claim 1, wherein the thin metal layer provides a minimum optical density of 2.0.

10 (original). The combination as claimed in Claim 1, wherein the substrate is about 84 - 90 % of the total film thickness.

*A4
cont.*
11 (original). The combination as claimed in Claim 10, wherein the polyethylene skin layer is about 0.5 to 1 micron.

12 (new). The combination as claimed in Claim 1, wherein the medium density polyethylene layer includes a hexane component.

13 (new). The combination as claimed in Claim 1, wherein the medium density polyethylene layer includes an octane component.

14(new). The combination as claimed in Claim 7, wherein the metal layer has a thickness of about 100 - 400 angstroms.
